

The exploration and development of safe alternatives to fossil fuels should be the most important global priority today.

To what extent do you agree do you agree or disagree?

That is a very nice feeling to imagine a `our world` with a pure energy. Nowadays, energy **became** (*has become*) an important portion of our life and use of energy is increasing incredibly and we are soon going to finish up all our resources of fossil fuels which are limited source of energy. While some people argue that we can still extract from abundant reservoirs of fossil fuels, I strongly believe that we should pay more attention to more developed safe alternatives.

First of all, industries are big **consumer** of underground energy sources. In this time and age, factories, industrial workshops, and electricity production equipments are entirely dependant to fossil fuel energy and development of industries are going to increase the usage of this kind of fuels. What is the bottom line: They either finish underground sources of energy or pollute the air . So we have to replace it with safe and pure energy.

Second, developed countries play quite an essential role in contributing to safe energy supplies. Using pure natural source to produce energy such as wind power, water power and the like are noteworthy solutions; however, they can be used in some specific places and probably in only a few countries. Some other modern types of energy sources: namely nuclear energy and solar energy can be developed and put to use in all over the world if only the industrial countries allow the rest of the world to get to know the proper knowledge and technology of using the pure energy.

Third, energy saving and culture of effective usage of energy should be considered, worked out and spread. We should prevent energy waste in our design issues. For instance, in our houses, we waste about 30% of energy **in order to** (due *mainly to*) our bad habits and bad design of buildings. People **need to be learned** (need *be taught*) and recommended to observe and mind energy saving culture and substitute safe and pure energy as well.

All in all, finding and developing safe energies is not only the governments and industries duty, but also it is a huge responsibility ` on the shoulder ` of every body. We should

respect energy saving advices and even change our house instrument into safe and pure energy supply, like solar heating system. Transferring into safe alternatives of fuels needs close and hand- in -hand cooperation of government and the people.

Comments: This is a nice essay. Nevertheless, there are some flashy dreadful mistakes to be strictly avoided. Still the Tenses. The underlined are the nice use of proper language.

There is yet more to it than that: he TOPIC SENTENCES. They should captivate the main reasons. Compare with the below:

First, all the studies demonstrate that the fuel reservoirs are soon to be depleted.

Second, Most of the current causes of pollutions of any type is caused by the burning of fossil-fuel products.

Third, other modern sources of energy may bring about other advantages ; namely higher speed, more safety, more access , and the like.
