

The 21st century has begun. What changes do you think this century will bring? Use examples and details in your answer.

Comparing where we are standing right now, just with the last 50 years, shows that human's lifestyle has changed a lot, in an unbelievable way that no one could even imagine such a development through a very short period of time. Apparently, most of it is owed to the scientific achievements in the late 20th century, which has introduced the "Computer" and the "Internet" as two most important inventions of the whole history.

The most outstanding feature of this century might be the speed of life. As a result of recent-modern-technologies and telecommunications many of us have this chance to do lot's of our daily stuff in a blink of an eye-*it is just a click away*. As a consequence, simplicity, comfort, accuracy and reliability are brought to our lives.

Not only will the pace of the life change but also many other aspects of it will be revolutionized in upcoming years. Driving full-automatic cars, living in apartments with hi-tech facilities and even space-traveling will be easily attainable. In another word, the 21st century is the time to dream big.

Changes are not always for good though. On the one hand, there are still people who are not familiar with modern technologies and have got problems using them. On the other hand, as computers and robots are *`taking the human's place`* in many vital roles, in near future, many of workforces might loose their jobs which seem to be the most important obstacles of next decades.

To conclude, our life has always been changing, the 21st century like any other stages of human beings history will bring its own up- and-downs to our lives.

Comment: The thesis is disclosed in a somewhat new manner. The variety of Punctuations is used. There is, however, space for furnishing more supporting ideas. Pay special attention to the second Topic Sentence as it is grammatically note-worthy.
